Mendel's Principles •Principle of Segregation - In meiosis, the two alleles for a trait segregate (\_\_\_\_). Each egg or sperm cell receives a copy of one of the two alleles present in the somatic cells of the organism. There is a \_\_\_\_ chance that a copy of that allele will end up in the gamete produced.

Each gamete acquires one of the two alleles as chromosomes separate into different gametes during meiosis. Heterozygotes, which possess one dominant and one recessive allele, can receive each allele from either parent and will look identical to homozygous dominant individuals; the Law of Segregation supports Mendel's observed 3:1 phenotypic ratio. Mendel proposed the Law of Segregation after observing that pea plants

Mendel's three famous hypotheses elegantly explained genetics to a generation that was wholly ignorant of chromosomes and genes in the way that modern geneticists understand them. The duplication of a cell results in the duplication of DNA as it divides twice to produce four reproductive cells. It is this process that is known as meiosis.
