As it happens, there most certainly is a most practical motivation from geometry to topology, one could say a bridge from the one to the other (no relation to Koenigsberg), and H. Graham Flegg marvelously explains just exactly what this bridge is all about. Read more. 4 people found this helpful.

This introduction to topology eases readers into the subject by building a bridge from the familiar concepts of geometry to the formalized study of topology. Focuses on congruence classes defined by transformations in real Euclidean space, continuity, sets, functions, metric spaces, and topological spaces, and more. Exercises and Problems.

Distinction between geometry and topology. Geometry has local structure (or infinitesimal), while topology only has global structure. Alternatively, geometry has continuous moduli, while topology has discrete moduli. By examples, an example of geometry is Riemannian geometry, while an example of topology is homotopy theory.

Topological geometry deals with incidence structures consisting of a point set and a family of subsets of called lines or circles etc. such that both and carry a topology and all geometric operations like joining points by a line or intersecting lines are continuous. As in the case of topological groups, many deeper results require the point space to be (locally) compact and connected.
