Partial suppression of the frizzled plumage of heterozygous Frizzles is induced by a recessive autosomal gene, mf, which is independent of the gene for frizzling. This modifying gene is manifested when homozygous in all birds heterozygous for frizzling and in about 40 per cent. of those homozygous for frizzling.

POLYDACTYLISM, when studied in vertebrates, has usually been shown to be a heritable characteristic, although in some instances the mode of inheritance has been somewhat involved. In the case of the fowl, the usual number of toes is four although five toes constitute a breed characteristic in some instances.

The fully-pearled gene is the dominant one, just like in the pearl grey. So a bird with two pearled genes (SS) will look fully-pearled. The semi-pearled gene (ss) is the recessive version here, and so you will need two of them for them to show up. A Royal Purple guinea has a grey background colour, and is semi-pearled.
