Sedimentary Environments is one of the most distinguished and influential textbooks in the earth sciences published in the last 20 years. The first and second editions both won universal praise and became classic works in sedimentology. Since the publication of the last edition, the study of sedimentary environments and facies has made great strides, with major advances in facies modelling, sequence stratigraphy and basin modelling.

Sedimentary facies, physical, chemical, and biological aspects of a sedimentary bed and the lateral change within sequences of beds of the same geologic age. Sedimentary rocks can be formed only where sediments are deposited long enough to become compacted and cemented into hard beds or strata. Sedimentation commonly occurs in areas where the sediment lies undisturbed for many years in sedimentary basins.

In geology, depositional environment or sedimentary environment describes the combination of physical, chemical and biological processes associated with the deposition of a particular type of sediment and, therefore, the rock types that will be formed after lithification, if the sediment is preserved in the rock record.

It is important to remember that the sedimentary environment is the combination of physical, chemical and biological processes that influence sediment deposition, whereas sedimentary facies are the characteristics of the rocks/sediments after deposition.

Our work is focused on understanding the physical, chemical, and biological controls on the characteristics and distribution of sedimentary facies. We are particularly interested in studying modern siliciclastic depositional environments to use them as analogues for understanding Earth's surface processes and deposits from the geological past.

The most proximal(close to sediment source) and coarse grainedof water-transported sedimentary environments is the alluvial fan. These cone shaped depositsform where high gradient narrow canyon streams discharge onto flat plains at the mouths of canyons. At this point, streams typically lose the competenceto transport framework clasts.

Sedimentary Environments. 2. Introduction The sedimentary environment is the specific depositional setting of a particular sedimentary rock and is unique in terms of physical, chemical, and biological characteristics. The physical features of a sedimentary environment include water depth and the velocity and persistence of water. Chemical characteristics of an environment

include the salinity (proportion of dissolved salts), acidity or basicity (pH), oxidation potential (Eh), pressure, ...
